What is a Beaver?
Beavers are considered to be the largest rodent in North America.

Someone who is searching for a beaver can find one in Europe or North America. Their names match where you might spot them. The beaver found in North America is named a North American Beaver and the beaver found in Europe is often referred to as a European Beaver.

Have you seen a beaver? They are often spotted in ponds, rivers, streams, and other bodies of water.
Characteristics of Beavers

Beavers are mostly awake at night. This makes them nocturnal. A beaver’s hair is waterproof, so beavers will not get sick from the different water temperatures.

A beavers’ teeth never stop growing, but beavers eat and chew on wood so much that their teeth always stay the same size. Beavers use their tails for guiding their swimming and scaring away predators.
Beavers are Mammals

This means that they are warm blooded, they have babies like humans, and they have hair on their body.
Beaver Families

Beavers are **monogamous**, so they keep one **mate** their entire life. If one dies, the live beaver will find another mate.

Female beavers are only pregnant for 3 months. These baby beavers are called **kits**, and there are usually 1 to 4 kits per litter.
How Long Do Beavers Stay with Their Families?

These baby kits will stay with their family for about two years. After two years, the maturing beavers will make their own home a few kilometers away.

Once the beaver has reached the age of 3, he or she is ready to make their own family. Beavers are very protective of their homes and families. Each beaver can live 10-20 years.

When do beavers leave home?
Beavers Rely on Water
Beavers build their homes in water, and they use water to protect themselves from predators.

A beaver has a special respiratory system that lets him hold his breath for up to 15 minutes.
Beavers Build Dams out of Wood

Beavers use trees for eating and making dams. Dams are many pieces of wood that block the flow of water.

Beavers are unique because they are actually able to eat the bark of trees. This is convenient because beavers can have a meal while felling a tree that they use to create a dam or lodge to live in. Building in the middle of water helps protect the beavers and their kits from other animals.
This is a beaver’s dam. Can you tell that one side of the water is higher than the other side?

This is because the dam blocks the flow of water, so the direction that the body of water is flowing from will be higher than the other side.

People have used beavers’ techniques to create their own dams to give power to cities and states. Beavers are one of the most hard-working mammals.
Beavers Live in Lodges
Beavers live in lodges that are built out of trees. Their entrance is underneath the water. Around six beavers usually share one lodge. When the beaver first enters, he or she will enter a den, which is for drying off. Then there is a second den, which is where the beavers spend most of their time. Because of the way beavers’ lodges are built, they can easily withstand cold temperatures.

Beavers often share their homes with other creatures such as muskrats. The extra helpers gather food and keep the lodge warm.
Beavers Can Cause Destruction
Sometimes beavers cause deforestation. Deforestation happens when beavers strip all of the trees in an area of their wood.

Beavers can also cause flooding because when they build their dams the water gets too high. They can also cause droughts when the water gets too low, which prevents water from getting to another area.

Most of the time however, beavers prevent this from happening. Beavers can prevent flooding or droughts.
**Where can you find a beaver?**

Glossary

**Deforestation:** This is a forest with little to no trees.

**Den:** A part of a beaver’s home.

**Destruction:** If something causes so much damage that there is no repair.

**Kits:** Baby beavers.

**Kilometers:** A form of measurement, 5 kilometers is equal to about 3 miles.

**Litter:** A group of kits born at once.

**Lodges:** A beaver’s home.

**Mate:** A beaver’s “wife” or “husband”.

**Maturing:** To get older.

**Monogamous:** To stay with one mate.

**Nocturnal:** To be awake mostly at night.

**Predators:** Animals that hunt prey, or in this case, beavers.

**Rodent:** Usually small mammals that include rats and hamsters as well.
