YALE E. GODFREY L. C. WARMAN

ALBRIGHT ON "SOFT PLACES"

"soft places" of the earth, as defined by Dr. L. C. Warm. The earth is divided into two main areas: the soft places and the hard places. The soft places are areas where the earth's surface is soft and yielding, such as plains and valleys. The hard places are areas where the earth's surface is hard and resistant, such as mountains and ridges. The soft places are more likely to accumulate water and are therefore more susceptible to erosion. The hard places are more likely to retain water and are therefore more resistant to erosion.

"WAR SENTIMENT STUDENTS GROW"-LINDSEY, GONZAGA HEAD

In the autumn of the year 1923, a third class student in the University of Washington, a young man by the name of Paul M. Wengren, created a stir in the scientific world when he announced the discovery of a new form of life in Columbia River specimens. This discovery was not merely an accidental find, but the result of a long series of experiments conducted by Wengren and his colleague, Professor Thomson. The specimens were collected from the river at various points, and the results of the experiments were published in a series of papers in the leading scientific journals of the day.

The discovery of these specimens was a milestone in the history of biology. It opened up a new field of research, and the findings of Wengren and Thomson were soon hailed as a major breakthrough in the understanding of life. The specimens were studied in great detail, and the results were published in a series of papers in the leading scientific journals of the day.

In the years that followed, the specimens continued to be studied, and their findings were incorporated into the new field of biotechnology. The specimens were used as a model for the study of new forms of life, and their findings were incorporated into the new field of biotechnology. The specimens were used as a model for the study of new forms of life, and their findings were incorporated into the new field of biotechnology.

Today, the specimens are housed in the collections of the University of Washington, and their findings continue to be studied by scientists around the world. The specimens are an ongoing source of inspiration, and the findings continue to be incorporated into the new field of biotechnology.
